Reaction Paper on Cybersecurity Settings in the Philippines

As an IT student in the Philippines, I've always been fascinated by cybersecurity. Recently, I watched some videos that talked about cybersecurity problems in our country. These videos not only taught me about the current situation but also made me think about what it means for our future online.

The videos showed some worrying trends. It turns out that the Philippines is a big target for cyber attacks. This is especially scary because even government offices get attacked a lot. It makes me wonder if our important information is safe. Plus, there aren't enough experts in cybersecurity here. As an IT student, this worries me because it shows how urgent it is for us to learn how to protect our digital stuff.

One video talked about how hackers tried to break into government offices like the Department of Information and Communications. It's a reminder of how easy it can be for hackers to get into our systems. And if they do, they could steal important documents and data. It's also concerning that most cybersecurity experts work in private companies or in other countries. We need more experts here to help keep us safe.

I also learned about different kinds of hackers from an interview with a cybersecurity expert named Jay Ricky Villarante. He explained how hackers can be good or bad, depending on their intentions. It's clear that we need to work together to solve these cybersecurity problems. That means educating ourselves, creating better rules, and working with others to protect our digital world.

In conclusion, these videos made me realize how important it is to tackle cybersecurity issues in the Philippines. As an IT student, I understand the need to keep our digital information safe. We need to invest in education, training, and teamwork to make sure we're ready to face the challenges ahead and keep our country's digital future secure.
